Functional principle

Step 1 - Heating:

Heat the inlet air to the desired temperature (max. 120 °C)

Step 2 - Droplet formation:

Ultrasonic nebulizer

Step 3 - Drying chamber:

Conductive heat exchange between drying gas and sample droplets.

Step 4 - Particle collection:

Electrostatic particle collector

Step 5 - Outlet filter:

Collection of finest particles to protect the user and the environment.

Step 6 - Drying gas:

Delivered by aspirator or compressed air

Functional principle of the spray head

The nebulizer unit includes a piezoelectric actuator with a thin stainless steel membrane. The membrane has an array of micron-sized holes, vibrating at ultrasonic frequencies (80-140 kHz), thus ejecting a large amount of precisely sized microdroplets at high speed.

Functional principle of the electrostatic particle collector

Solid particles are accumulated at the wall of the cylindrical particle collecting electrode by a strong electrical field.
